Femtosecond Laser Assisted Cataract Surgery Versus Phacoemulsification Heather Chen, 2016 Visual acuity and refractive outcomes of femtosecond laser are statistically equivalent to those of conventional phacoemulsification surgery in this meta analysis. Several factors such as the learning curve may account for these early results. Further long term studies are needed to better evaluate the impact of femtosecond lasers on cataract surgery outcomes.

Benefits and Harms of Femtosecond Laser Assisted Cataract Surgery Ana R. Quiñones, 2013 The preferred method of removing cataracts in the developed world is phacoemulsification. Using this technique ultrasonic energy softens the dense lens material of the cataract which is then extracted from the eye with suction and irrigation. Current practice includes creating manual corneal incisions and anterior capsulotomies followed by phacoemulsification. Recently these three manual procedures have been performed in an automated fashion with the use of the femtosecond laser FSL. Several FSL systems have been approved by the FDA for use in the U S for some or all of these procedural steps in cataract surgery. FSL technology has been widely used in various refractive surgery applications in recent years. Studies have suggested decreased phacoemulsification energy use with FSL cataract surgery and have examined the potential advantages of more precise corneal incisions and capsulotomy formation. Cataract surgery is a frequently performed operation in the VHA with more than 49 000 performed in 2012. As a result the VHA National Surgery Office has been tasked with making a recommendation regarding whether femtosecond lasers provide appropriate cost benefit and risk benefit.
