

The assessment data is compared with the defining characteristics of the problem to ensure that the correct problem is identified.

The nurse plans interventions to promote communication with Frank.

When speaking with Frank, which approach should be included? Use low-pitched conversational tones.

Persons with a hearing impairment generally hear low-pitched tones better than high-pitched tones. A normal conversational voice is a lower pitch than shouting. In addition, the nurse should stand in front of the client, use facial and body language to promote communication, speak toward the better ear, and emphasize consonants when speaking.

Music is playing loudly through the exam room's intercom system. A practical nurse (PN) enters the room and turns the music off before speaking with Frank.

Which action should the nurse implement? Affirm that the PN's action may assist Frank's ability to hear by eliminating background noise.

Clients with a hearing impairment have difficulty hearing conversation when there is background noise, such as music or other conversations.

Frank is referred to vision and hearing specialists for more in-depth evaluation and treatment. A medical diagnosis of cataracts is identified as the cause of Frank's visual deficit. Noise-induced hearing loss as well as changes related to aging are identified as the causes of Frank's auditory deficit. Frank is scheduled for eye surgery in three weeks. The nurse teaches Frank about the administration of the eye drops he will need to administer. The prescription states, "2 gtt's in left eye twice a day."

Which direction should the nurse provide Frank? Place two drops in the left eye every 12 hours.

These are the correct directions.

Frank demonstrates the eye drop procedure by holding the outer canthus up and back, inserting the drops without touching the eye with the dropper, and applying light pressure over the inner canthus.

Which action should the nurse take? Teach the client to pull the conjunctival sac down while administering the medication.

The outer canthus is not held during the administration of eye drops. The conjunctival sac at the bottom of the eye is pulled downward so the medication can be administered without directly applying it to the cornea.

After learning to self-administer eye drops, Frank is preparing to go home. The nurse has identified that Frank is at risk for injury because of his visual and auditory sensory deficits.

Which action should the nurse implement? Make plans with Frank for a family member to help him assess his home for safety hazards.
