Fluor Engineering Design Manual:

Pressure Vessel Design Manual Dennis R. Moss, Michael M. Basic, 2012-12-31 Pressure vessels are closed containers designed to hold gases or liquids at a pressure substantially different from the ambient pressure. They have a variety of applications in industry including in oil refineries, nuclear reactors, vehicle airbrake reservoirs, and more. The pressure differential with such vessels is dangerous and due to the risk of accident and fatality around their use, the design, manufacture, operation, and inspection of pressure vessels is regulated by engineering authorities and guided by legal codes and standards. Pressure Vessel Design Manual is a solutions-focused guide to the many problems and technical challenges involved in the design of pressure vessels to match stringent standards and codes. It brings together otherwise scattered information and explanations into one easy-to-use resource to minimize research and take readers from problem to solution in the most direct manner possible. Covers almost all problems that a working pressure vessel designer can expect to face with 50 step-by-step design procedures including a wealth of equations, explanations, and data. Internationally recognized, widely referenced, and trusted with 20 years of use in over 30 countries, making it an accepted industry standard guide. Now revised with up-to-date ASME, ASCE, and API regulatory code information and dual unit coverage for increased ease of international use. *Marine Engineering/log*, 1985 *Noise Control Engineering Journal*, 1985 *Hawaii Industry*, 1961

Downstream Industrial Biotechnology Michael C. Flickinger, 2013-03-12 DOWNSTREAM INDUSTRIAL BIOTECHNOLOGY
An affordable, easily accessible desk reference on biomanufacturing focused on downstream recovery and purification. Advances in the fundamental knowledge surrounding biotechnology, novel materials, and advanced engineering approaches continue to be translated into bioprocesses that bring new products to market at a significantly faster pace than most other industries. Industrial-scale biotechnology and new manufacturing methods are revolutionizing medicine, environmental monitoring, and remediation, consumer products, food production, agriculture, and forestry and continue to be a major area of research. The downstream stage in industrial biotechnology refers to recovery, isolation, and purification of the microbial products from cell debris, processing medium, and contaminating biomolecules from the upstream process into a finished product such as biopharmaceuticals and vaccines. Downstream process design has the greatest impact on overall biomanufacturing cost because not only does the biochemistry of different products (e.g., peptides, proteins, hormones, antibiotics, and complex antigens) dictate different methods for the isolation and purification of these products, but contaminating byproducts can also reduce overall process yield and may have serious consequences on clinical safety and efficacy. Therefore, downstream separation scientists and engineers are continually seeking to eliminate or combine unit
