Fluctuation Phenomena Studies In Statistical Mechanics Vol 7:

Fluctuation Phenomena E. W. Montroll, Joel Louis Lebowitz, 1987 Fluctuation phenomena are the tip of the iceberg revealing the existence behind even the most quiescent appearing macroscopic states of an underlying world of agitated ever changing microscopic processes While the presence of these fluctuations can be ignored in some cases e g if one is satisfied with purely thermostatic description of systems in equilibrium they are central to the understanding of other phenomena e g the nucleation of a new phase following the quenching of a system into the co existence region This volume originally published several years ago has stood the test of time well as interest in fluctuation phenomena continues to grow It contains a collection of review articles some of them updated written by experts in the field on the subject of fluctuation phenomena Some of the articles are of a very general nature discussing the modern mathematical formulation of the problems involved while other articles deal with specific topics such as kinetics of phase transitions and conductivity in solids The juxtaposition of the variety of physical situations in which fluctuation phenomena play an important role is novel and should give the reader a comprehensive and deeper insight into this fascinating subject

Stochastic Processes, Multiscale Modeling, and Numerical Methods for Computational Cellular Biology David Holcman, 2017-10-04 This book focuses on the modeling and mathematical analysis of stochastic dynamical systems along with their simulations The collected chapters will review fundamental and current topics and approaches to dynamical systems in cellular biology This text aims to develop improved mathematical and computational methods with which to study biological processes At the scale of a single cell stochasticity becomes important due to low copy numbers of biological molecules such as mRNA and proteins that take part in biochemical reactions driving cellular processes When trying to describe such biological processes the traditional deterministic models are often inadequate precisely because of these low copy numbers This book presents stochastic models which are necessary to account for small particle numbers and extrinsic noise sources The complexity of these models depend upon whether the biochemical reactions are diffusion limited or reaction limited In the former case one needs to adopt the framework of stochastic reaction diffusion models while in the latter one can describe the processes by adopting the framework of Markov jump processes and stochastic differential equations *Stochastic Processes Multiscale Modeling and Numerical Methods for Computational Cellular Biology* will appeal to graduate students and researchers in the fields of applied mathematics biophysics and cellular biology

Phase Transition Dynamics Akira Onuki, 2002-06-06 Phase transition dynamics is centrally important to condensed matter physics This 2002 book treats a wide variety of topics systematically by constructing time dependent Ginzburg Landau models for various systems in physics metallurgy and polymer science Beginning with a summary of advanced statistical mechanical theories including the renormalization group theory the book reviews dynamical theories and covers the kinetics of phase ordering spinodal decomposition and nucleation in depth The phase transition dynamics of real systems are discussed treating interdisciplinary problems in a unified manner Topics

include supercritical fluid dynamics stress diffusion coupling in polymers and mesoscopic dynamics at structural phase transitions in solids Theoretical and experimental approaches to shear flow problems in fluids are reviewed Phase Transition Dynamics provides a comprehensive account building on the statistical mechanics of phase transitions covered in many introductory textbooks It will be essential reading for researchers and advanced graduate students in physics chemistry metallurgy and polymer science

Simplicity of Complexity in Economic and Social Systems Dariusz Grech, Janusz Miśkiewicz, 2020-11-08 This book presents the Proceedings of the 54th Winter School of Theoretical Physics on Simplicity of Complexity in Economic and Social Systems held in Łódź Poland from 18 to 24 February 2018 The purpose of the book is to introduce the new interdisciplinary research that links statistical physics and particular attention is given to link physics of complex systems with financial analysis and sociology The main tools used in these areas are numerical simulation of agents behavior and the interpretation of results with the help of complexity methods therefore a background in statistical physics and in physics of phase transition is necessary to take the first steps towards these research fields called econophysics and sociophysics In this perspective the book is intended to graduated students and young researchers who want to begin the study of this established new area which connects physicists economists sociologists and IT professionals to better understand complexity phenomena existing not only in physics but also in complex systems being seemingly far from traditional view at physics

Determination of Complex Reaction Mechanisms John Ross, Igor Schreiber, Marcel O. Vlad, 2005-11-24 In a chemical system with many chemical species several questions can be asked what species react with other species in what temporal order and with what results These questions have been asked for over one hundred years about simple and complex chemical systems and the answers constitute the macroscopic reaction mechanism In Determination of Complex Reaction Mechanisms authors John Ross Igor Schreiber and Marcel Vlad present several systematic approaches for obtaining information on the causal connectivity of chemical species on correlations of chemical species on the reaction pathway and on the reaction mechanism Basic pulse theory is demonstrated and tested in an experiment on glycolysis In a second approach measurements on time series of concentrations are used to construct correlation functions and a theory is developed which shows that from these functions information may be inferred on the reaction pathway the reaction mechanism and the centers of control in that mechanism A third approach is based on application of genetic algorithm methods to the study of the evolutionary development of a reaction mechanism to the attainment given goals in a mechanism and to the determination of a reaction mechanism and rate coefficients by comparison with experiment Responses of non linear systems to pulses or other perturbations are analyzed and mechanisms of oscillatory reactions are presented in detail The concluding chapters give an introduction to bioinformatics and statistical methods for
