## Fluent 14 Theory Guide:

**Continuous Casting** Michael Vynnycky, 2019-07-30 Continuous casting is an industrial process whereby molten metal is solidified into a semi finished billet bloom or slab for subsequent rolling in finishing mills it is the most frequently used process to cast not only steel but also aluminium and copper alloys Since its widespread introduction for steel in the 1950s it has evolved to achieve improved yield quality productivity and cost efficiency It allows lower cost production of metal sections with better quality due to the inherently lower costs of continuous standardized production of a product as well as providing increased control over the process through automation Nevertheless challenges remain and new ones appear as ways are sought to minimize casting defects and to cast alloys that could originally only be cast via other means This Special Issue of the journal Metals consists of 14 research articles that cover many aspects of experimental work and theoretical modelling related to the ongoing development of continuous casting processes [Sustainable Energy Systems Planning, Integration and Management](#) Kim Guldstrand Larsen, 2020-01-21 Energy systems worldwide are undergoing major transformation as a consequence of the transition towards the widespread use of clean and sustainable energy sources Basically this involves massive changes in technical and organizational levels together with tremendous technological upgrades in different sectors ranging from energy generation and transmission systems down to distribution systems These actions generate huge science and engineering challenges and demands for expert knowledge in the field to create solutions for a sustainable energy system that is economically environmentally and socially viable while meeting high security requirements This book covers these promising and dynamic areas of research and development and presents contributions in sustainable energy systems planning integration and management Moreover the book elaborates on a variety of topics ranging from design and planning of small to large scale energy systems to the operation and control of energy networks in different sectors namely electricity heat and transport *Recent Advances in Urban Ventilation Assessment and Flow Modelling* Riccardo Buccolieri, Jian Hang, 2019-04-23 This book contains twenty one original papers and one review paper published by internationally recognized experts in the Atmosphere Special Issue Recent Advances in Urban Ventilation Assessment and Flow Modelling years 2017 2019 The Special Issue includes contributions on recent experimental and modelling works techniques and developments mainly tailored to the assessment of urban ventilation on flow and pollutant dispersion in cities The study of ventilation is of critical importance as it addresses the capacity with which a built urban structure is capable of replacing the polluted air with ambient fresh air Here ventilation is recognized as a transport process that improves local microclimate and air quality and closely relates to the term breathability The efficiency with which street canyon ventilation occurs depends on the complex interaction between the atmospheric boundary layer flow and the local urban morphology The individual contributions to this Issue are summarized and categorized into four broad topics 1 outdoor ventilation efficiency and application development of ventilation indices 2 relationship between indoor and outdoor

ventilation 3 effects of urban morphology and obstacles to ventilation and 4 ventilation modelling in realistic urban districts The results and approaches presented and proposed will be of great interest to experimentalists and modelers and may constitute a starting point for the improvement of numerical simulations of flow and pollutant dispersion in the urban environment for the development of simulation tools and for the implementation of mitigation strategies **Progress in**
