Focus On Robotics Research Focus On Robotics Research:

Focus on Robotics Research John X. Liu, 2006 Robotics began as a science fiction creation which has become quite real first in assembly line operations such as automobile manufacturing aeroplane construction etc They have now reached such areas as the internet ever multiplying medical uses and sophisticated military applications Control of today's robots is often remote which requires even more advanced computer vision capabilities as well as sensors and interface techniques

Learning has become crucial for modern robotic systems as well This book brings together leading research in this exciting field

NASA Technical Memorandum, 1989 **THE 4TH WAVE** Honghyun JUNG (홍기훈), 2024-11-08 This book is a comprehensive exploration of the transformative impact of artificial intelligence on our world Divided into key sections it begins by detailing the history and evolution of AI tracing its journey from early concepts to the pivotal Fourth Wave where AI emerges as a game changing force across all industries The second part examines AI's extensive influence covering its effects on economics society culture politics and education while also addressing the ethical and environmental challenges it introduces Through examples and analysis readers will understand the shifts in labor markets the evolution of social interactions and the changing landscape of international relations in an AI driven age In its final section the book offers strategies for navigating this fast evolving AI era focusing on the need for workforce reskilling lifelong learning and the development of ethical inclusive AI practices It also emphasizes the importance of AI governance regulation and collaborative innovation positioning humanity at the heart of AI's future Whether you're an AI professional a student or simply curious about the future this book provides insightful perspectives on the opportunities and responsibilities that come with AI's rapid rise

Merging Symbolic and Data-Driven AI for Robot Autonomy Nikos Katzouris, Simona Perri, Mohan Sridharan, Daniele Meli, 2025-09-08 Robots are increasingly being deployed to assist and collaborate with humans in many applications such as medicine navigation and industrial automation To truly collaborate with humans in complex environments robots require advanced cognitive capabilities including the ability to reason with domain specific commonsense knowledge and the noise observations obtained in the presence of partial observability and non deterministic action outcomes Research in Artificial Intelligence AI has resulted in sophisticated symbolic formalisms that use temporal and logic relations to represent commonsense domain knowledge as well as probabilistic data driven frameworks that quantitatively represent uncertainty in the decision making process of robot systems Stand alone symbolic or stochastic AI methods have limitations when applied to robots in complex scenarios Symbolic AI methods reason with relational descriptions of the attributes of the domain and the robot to guide the robot's behavior It is however often computationally intractable to use these methods to reason about uncertainty quantitatively or to operate at the level of granularity required for precise interaction with objects in complex

domains Probabilistic and data driven AI methods on the other hand elegantly represent uncertainty quantitatively and provide mechanisms for reasoning and acting at the level of granularity required for interaction with the physical worlds These methods however offer limited expressiveness for complex cognitive concepts **IEEE ...
