A **GraphicsPath** object represents a set of sub-paths or **figures**. Each figure is a connected path, composed of a series of line and curve segments and geometric figures. These segments and geometric figures can be described in any of the standard ways we've seen already in this book – we can use arcs, Bézier curves, ellipses, rectangles, and so on. To create a figure, we simply list the components of the figure in the right order – the GraphicsPath object computes the figure to be the outline that results when these component outlines are joined together in the order specified. (We'll see some examples of this in the next section.)

The GraphicsPath itself is the path composed of the ordered set of figures. Because the set of figures is ordered, and because each figure is composed of an ordered set of lines and curves, the GraphicsPath itself is a path with a beginning and an end.

The figures within a GraphicsPath object don't need to be connected to one another – they can be disconnected. In particular, this means that the figures don't have to be top-to-tail on the drawing surface: in fact, usually, they're *not* top-to-tail and thus the path described by the GraphicsPath object is discontinuous. To follow such a path from one end to the other, we would need to 'leap through space' from the end of one figure to the beginning of the next.

The **Region** class is similar to the GraphicsPath path class, but it relates to areas (or regions) instead of paths. Thus, we can use a Region object to represent a shape, or a set of shapes. A region can consist of geometric shapes (like rectangles and ellipses) and/or custom shapes whose outlines are composed of whatever lines and curves we care to specify. Like a GraphicsPath, the shapes that make up a Region don't necessarily have to be connected.

Once we've created and defined a GraphicsPath object, we can draw it to our drawing surface using a Pen object. After constructing a Region object, we can fill the region using a Brush object. In both cases, there's an important point here. We can use the GraphicsPath and Region classes to compose complex paths and shapes; but the task of rendering the completed path or shape to the screen can be achieved *in a single method call*. This makes the rendering process much tidier, and also allows us to organize our code more tidily.

Let's start to look at some real GraphicsPaths and Regions, so we can get a better idea of how they work.

The GraphicsPath Class

The GraphicsPath class encapsulates a connected series of lines and curves. You may recall that we used a GraphicsPath object back in Chapter 3, to demonstrate the effect created by a PathGradientBrush.

Essentially, we use a GraphicsPath object when we want to describe an outline. Once we've described the outline, we can do a number of things with it: we can draw it using a pen, or fill its interior using a brush, or use it to create clipping regions.

We'll see all these applications of our outline during this chapter and the next. Before we get to that, we should look at some simpler examples and get the basics under our belt.

Composing a GraphicsPath

As we noted earlier in the section, before we can do anything with a GraphicsPath path, we need to compose it. A GraphicsPath is composed of an ordered set of figures; and each figure is composed of an ordered set of line and curve segments, and geometric figures.
